Question 1

Correct

A year Y will be passed as input. The program must find if the given year is a leap year or not.

- If it is leap year, the program must print yes else it should print no

**Note:** A year is a leap year if it is divisible by 4. If it is a century, then it should be divisible by 400.

The **pseudocode** is as given below:

```
if year is divisible by 400 then is_leap_year  
else if year is divisible by 100 then not_leap_year  
else if year is divisible by 4 then is_leap_year  
else not_leap_year
```

#### Example Input/Output:

If 2000 is the input, the program must print yes

If 2100 is the input, the program must print no

If 2013 is the input, the program must print no

#### Input Format:

A year as a number is passed to the standard input.

#### Output Format:

The string value as per the conditions above printed to the standard output.

#### Boundary Conditions:

0 < Y <= 8000

#### Input:

1980

#### Expected Output:

yes

#### For example:

Input	Result
1980	yes

**Answer:** (penalty regime: 0 %)

```
1 #include<stdio.h>
2 int main(){
3     int a;
4     scanf("%d",&a);
5
6     if(a%400==0||(a%4==0&&a%100!=0)) printf("yes");
7     else printf("no");
8     return 0;
9 }
```

	Input	Expected	Got	
✓	1980	yes	yes	✓

Passed all tests! ✓

**Question 2**

Correct

An expression E is passed as an input to the program. The expression will contain three numbers A, B and C, one equal symbol and one of the mathematical operators +, -, \*, /. But the given mathematical operator is incorrect and hence the expression is not valid. Hence the program must identify the correct operator and replace it.

**Input Format:**

First line will contain the expression E

**Output Format:**

First line will contain the correct mathematical operator

**Sample Input/Output:****Example 1:**

Input:

5-4=20

Output:

\*

Explanation:

Only 5 multiplied with 4 gives 20. Hence - must be replaced with \*.

**Example 2:**

Input:

999+9=111

Output:

/

Explanation:

Only 999 divided by 9 gives 111. Hence + must be replaced with /.

**For example:**

Input	Result
5-4=20	*
999+9=111	/

**Answer:** (penalty regime: 0 %)

```
1 #include<stdio.h>
2
3 int main(){
4     int a,b,c;
5     char op,eq;
6     scanf("%d%c%d%c%d",&a,&op,&b,&eq,&c);
7     if(a+b==c) printf("+");
8     else if(a-b==c) printf("-");
9     else if(a*b==c)printf("*");
10    else if(b!=0&&a/b==c) printf("/");
11
12    return 0;
13 }
```

	Input	Expected	Got	
✓	5-4=20	*	*	✓
✓	999+9=111	/	/	✓

Passed all tests! ✓
